

FALCONDALE

Quantum Machine Learning for Finance

We leverage quantum and quantum simulated capabilities

to boost machine learning for businesses risk assessment

SEE MORE [→](#)

Typical journey when fintechs and banks are providing credit services to businesses

The data scarcity and low performance of classical machine learning models represents a challenge.

FINTECHS

TRADITIONAL BANKS AND NEOBANKS

SMBs have different needs than large companies

47%

of SMBs believe that banks don't try to understand their challenges

14%

of total SMBs funding needs are met only

70%

of the growth economic output will be created by ecosystems in coming decades (SMBs)

QSAAS

Our core product

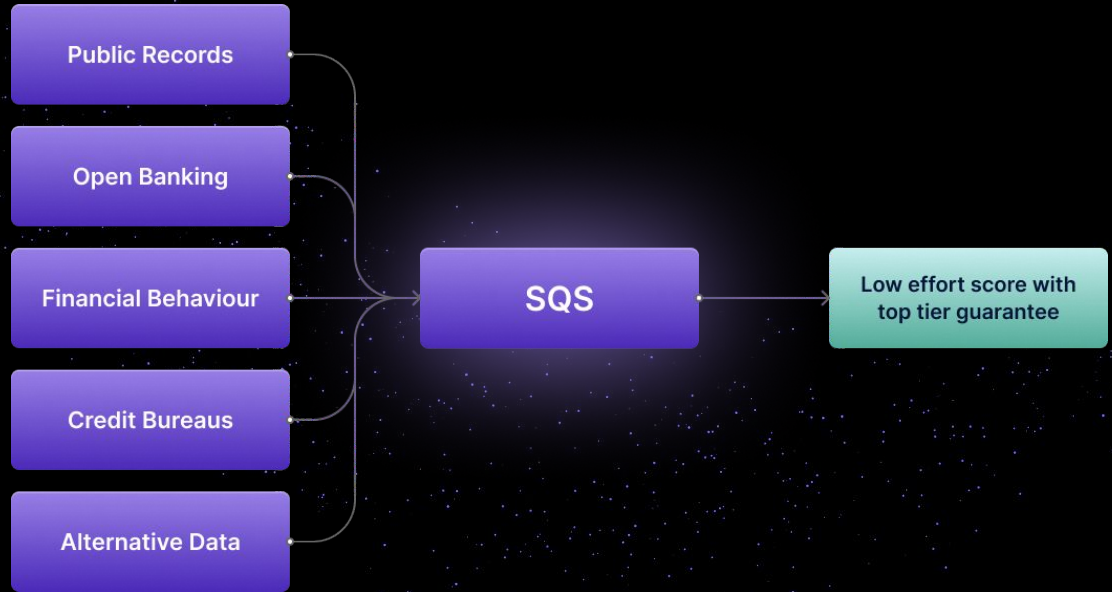

Systemic Quantum Score (SQS)

Highly accurate and proved scoring system specially designed to provide a risk score for businesses under different regimes of financial products.

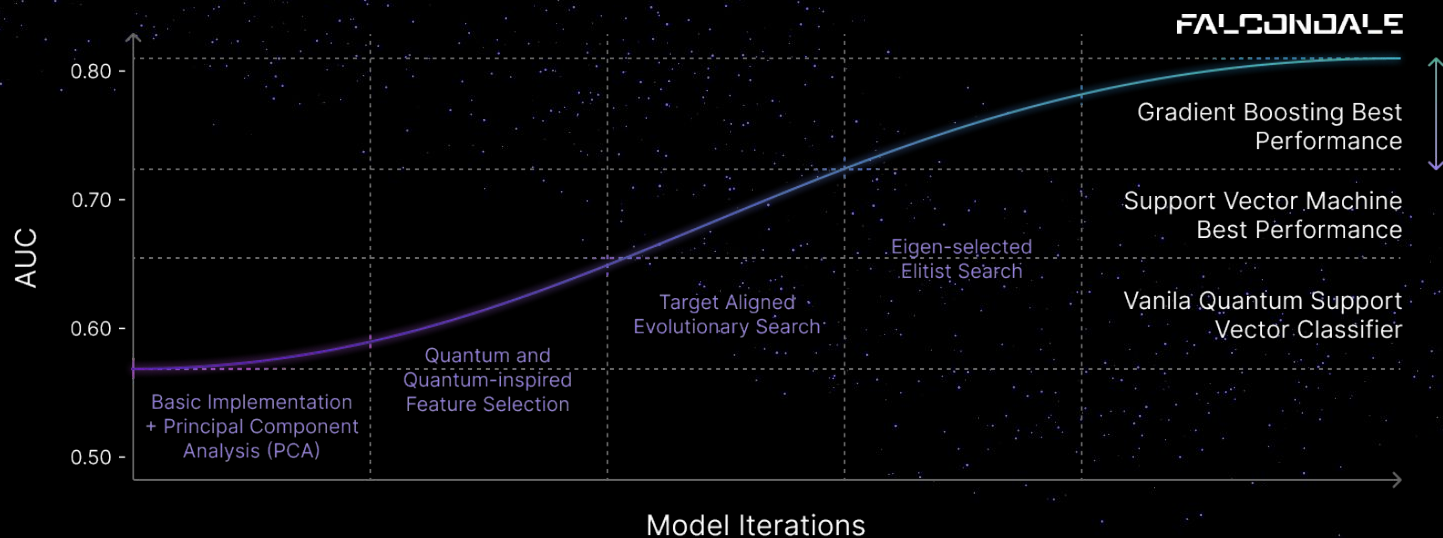

Systemic Quantum Score (SQS)

Supercharged scoring system
based on cutting edge
quantum methods.

We provide a tangible incremental benefit

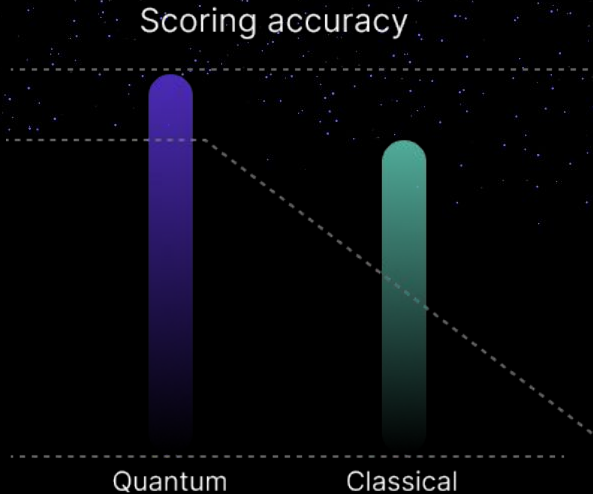

This margin in *AUC means a critical benefit in terms of default losses reduction.

*AUC measures from 0 to 1 a model's ability to distinguish classes (higher is better). For credit scoring, it's key for identifying likely defaulters, reducing financial risks.

Systemic Quantum Score (SQS)

Use case example our score methods versus classical approaches.

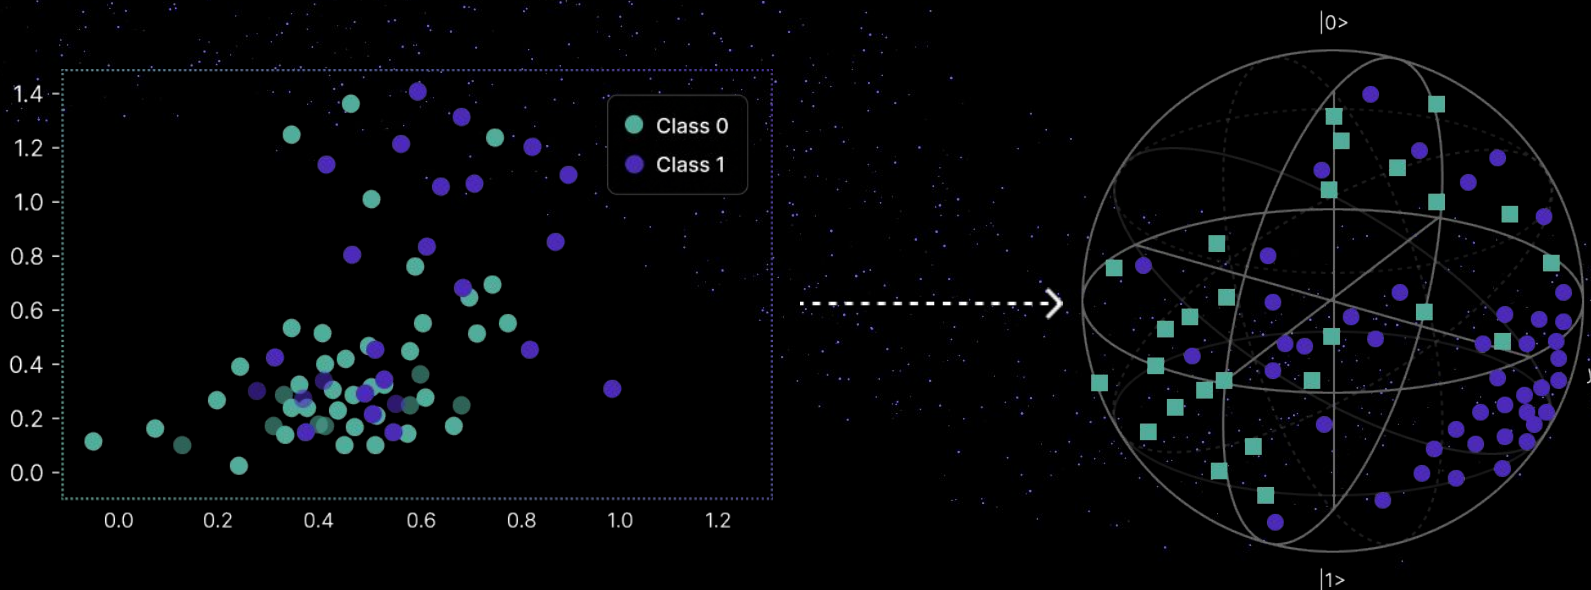

Working with higher dimensional regimes allows for better classification of individuals

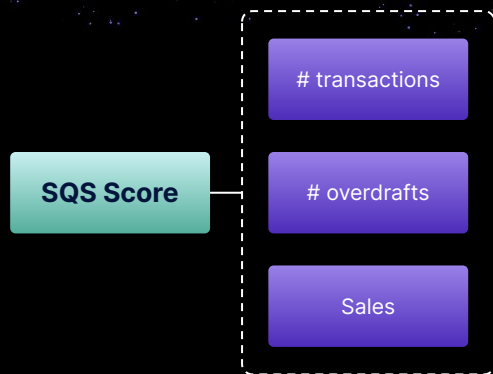

Under the hood of SQS

The power of quantum encoding gives the possibility to represent linearly separable data

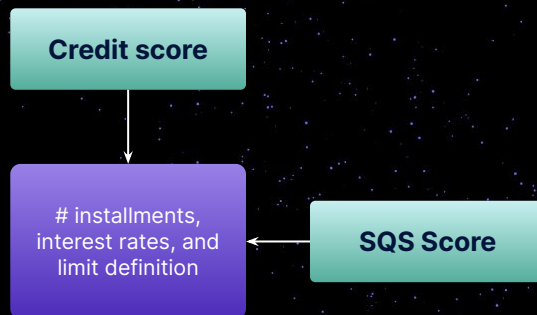

SQS can be used considering regulatory constraints

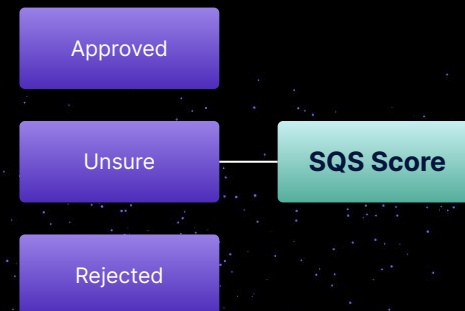

Extra feature for your internal model

Part of your affordability and credit product parameter definition

Portfolio augmentation on "gray" areas

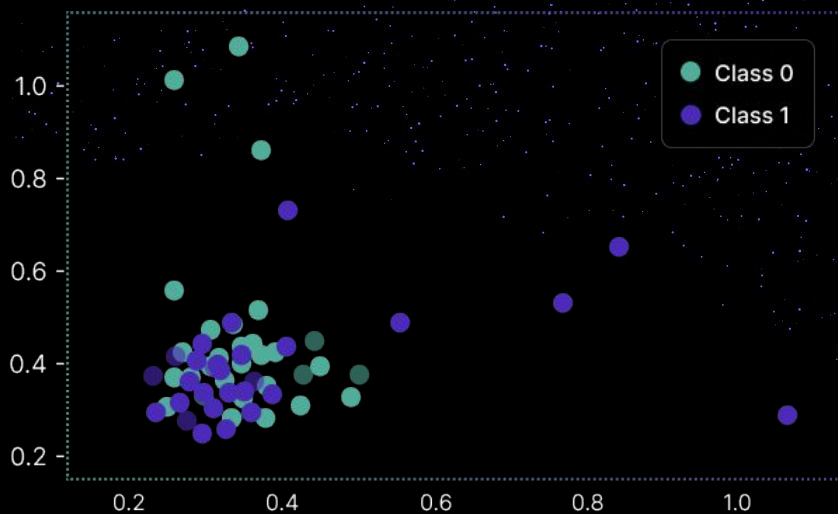

Also SQS **can be used for several other purposes** such as portfolio monitoring, fraud detection, upselling, credit card limit variations, among other cases.

Use case: The challenge

The “extra mile” in model performance

Non-linearly separable data

One of our clients decided to test our product facing the following difficulties:

- Scarcity of data (less than 5000 observations).
- Highly imbalanced.
- Over-engineered features.
- Limited capacity of reaching a better AUC with the classical methods.
- High percentage of false positives.

Use case: The method

Under the hood of SQS

We went from more than 300 features to select less than 10 to be used by SQS algorithm.

+300
features

Quantum-inspired
feature selection

Dimensionality
reduction (**<10**
features)

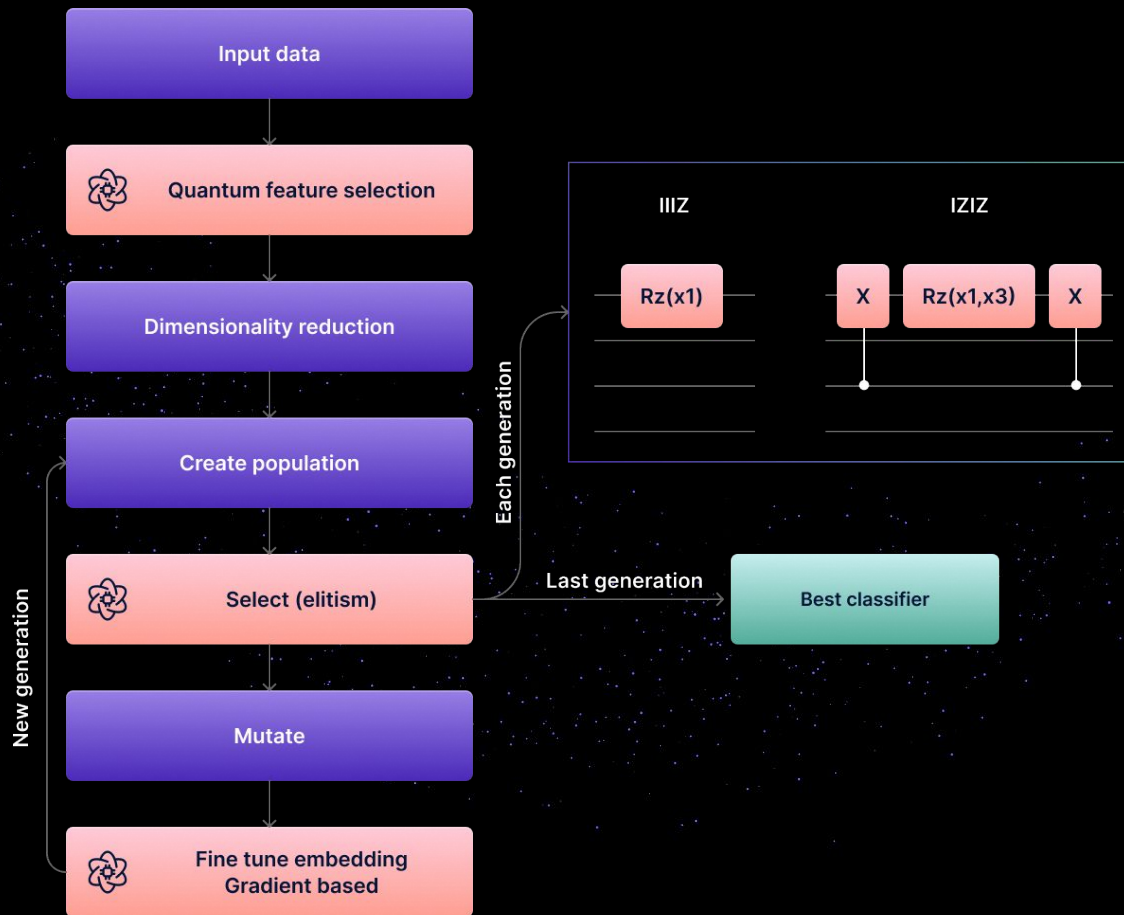

< 10
qubits

Under the hood of SQS

Evolutionary and gradient-based eigen-selected elitist search

A Pauli-based chromosome is used to explore feature maps through evolutionary methods aimed at increasing separability between inter- and intra-class kernel results. This process depends on analyzing the quantum kernel's internal statistics to optimize its performance, focusing later on target alignment, kernel matrix eigenvalues, and gradient-based fine-tuning.

[Research paper available in the arXiv.](#)

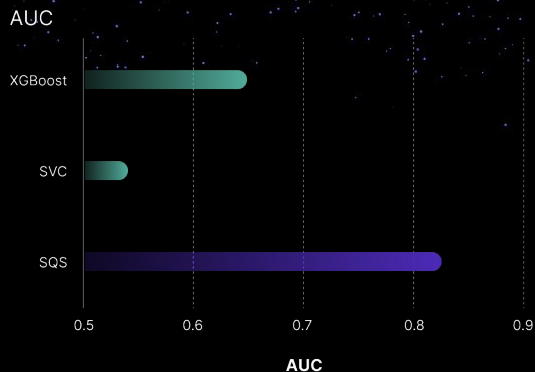

Use case: The results

Falcondale's SQS in action

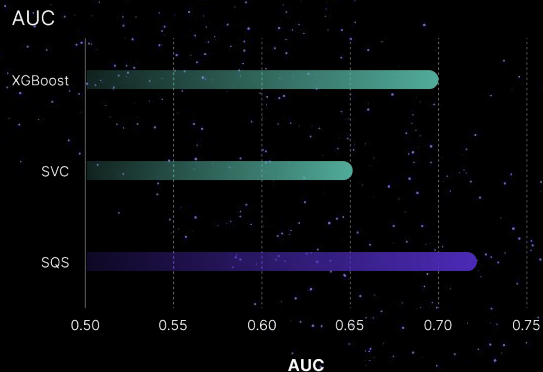

Comparison between SQS, SVC and XGBoost (both classical methods with tuned hyperparameters)

10% of the dataset

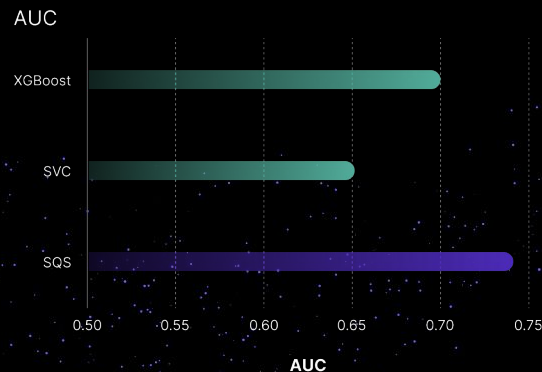

At 500 datapoints the AUC is superior compared to XGBoost by 18 percentage points.

50% of the dataset

At 2500 datapoints it's closer to XGBoost since the gradient boosting method is getting better with more observations but still SQS is superior.

100% of the dataset

With near to 5000 datapoints, SQS confirmed once more the superiority of the quantum simulated method having 4 percentage points in AUC higher than the best classical model.

Falcondale's SQS in action

Impressive results training with 10% of the dataset and testing remaining 90%

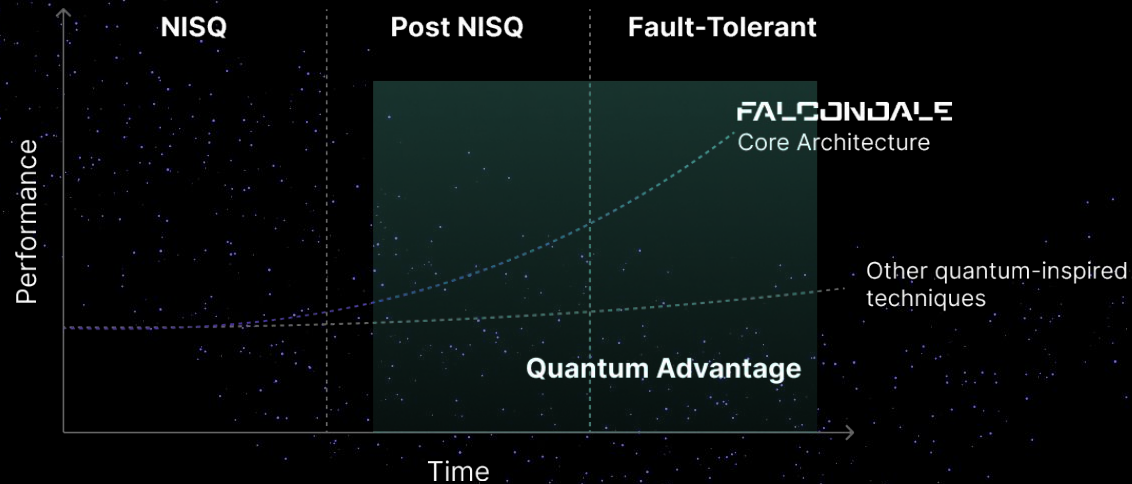

In a lower datapoints range and predicting on a larger dataset the AUC of SQS is 2 percentage points higher showing the special attribute of our quantum methods to deal with the problem of data scarcity.

This is a typical problem on several financial institutions when they are starting with some products or dealing with SMBs rather than individuals; so the dataset growth is slower and the model maturity is a complex subject.

An abstract digital graphic on the left side of the slide. It features a central diamond shape composed of a grid of points, with a square-in-square pattern inside. The diamond is surrounded by various circuit-like patterns, including lines, nodes, and circular motifs. The colors are primarily purple, pink, and blue, set against a dark background with a starry pattern.

Securing post NISQ scalability

Our core architecture can be switched to real quantum hardware

Seamless QML

Best in class partners to boost
our quantum hardware
adoption.

fermioniq

Emulate device noise model for the heavy-lifting before the device

oqc

Exploit the quantum hardware and make it cost efficient

Secure by
default

DATA SECURE AND ALWAYS SAFE

Data will be managed in an extremely secure environment.

All our processes will be SOC 2 and ISO 27001 certified and compliant.

Bringing quantum computing where your data is

SQS can be used:

- In our public platform.
- Deployed on cloud hosted private infrastructure leveraging the full potential of cloud computing and customer data.
- On-premises with dedicated resources and no outside service thanks to cutting-edge quantum simulation mechanisms.

The modular solution of SQS allows to involve customer-owned data in those scenarios where no client data will be exposed, prioritizing private computing, federated learning and synthetic data enabling technologies alongside the existing customer infrastructure.

We embrace regulatory challenges

Our solutions are prepared to follow the most stringent regulatory environments

Our models are designed to tackle with the most precision available in the quantum-enhanced machine learning solutions, three main pillars:

1. Interpretability of results.
2. Ensure adequate understanding of the process and decision.
3. Evaluating the generalization capabilities of our algorithms.

We follow the recommendations of the European Banking Authority (EBA) in terms of Internal Ratings-based (IRB) models.

BENEFITS

Improved data preparation

ML used in validation

↑ predictive power

CHALLENGES

Validation of ML models

Governance

Overfitting

Interpretability

Flexible pricing

All the possibilities to grow with us

Community based engagement scaled to enterprise scale needs.

Recognized in multiple scenarios

- Selected in the top 7 pitches in the Q2B 2023 conference in Silicon Valley.
- Approved as use case speakers in the Q2B 2024 conference in Paris and evaluated by the stakeholders as “a powerful presentation”.
- Nominated for an award in the SME Banking Conference in Vienna 2024 (to be executed in November this year).
- Our CEO was recognized for three consecutive years as Quantum Computing LinkedIn Top Voice.

*Our CEO, Javier Mancilla, presenting a use case with the SQS solution at Q2B Paris 2024 conference.
